Reflection Questions:

1. Did your estimations reflect the actual effort?

Mostly yes — Stories like 1.1 (targeting rule evaluation) and 3.1 (real-time SDK sync) were correctly estimated as high-effort (8 pts) due to the complexity of consistent hashing and streaming infrastructure. Simpler stories like 4.1 (audit logging) were reasonably scoped at 5 pts. In a real team setting, planning poker would likely have surfaced some disagreement on Story 3.2 (fallback caching), since edge-case failure handling is often underestimated.

2. Was your backlog well-prioritized?

Yes — all core evaluation and rollout logic (Epics 1 & 2) was marked High priority and scheduled in Sprint 1, since a feature flag system is non-functional without accurate evaluation. Audit logging (Medium priority) was correctly deferred to Sprint 2 since it's a supporting/compliance feature rather than a blocking one.

3. How did your simulated sprint align with your plan?

Both sprints completed all planned stories, so the burndown chart trended toward zero by sprint end without major replanning. This is expected in a simulated single-person sprint; in a real team, competing priorities or blockers would likely cause the burndown line to deviate from the ideal guideline.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart shows story points completed over time versus the ideal linear guideline. Since this was a simulated sprint (moving all tasks to Done quickly), the chart likely shows a sharp late drop rather than steady daily progress — a real team would want a smoother, more linear burn to indicate healthy day-by-day capacity rather than last-minute completion.
